## **EXECUTIVE SUMMARY**

This document summarizes monthly groundwater monitoring and sampling performed by Harding Lawson Associates in September and October 1998 at the Boeing Realty Corporation C-6 facility, 19503 South Normandie Avenue, Los Angeles, California (the Site, Plate 1).

The following is a summary of field activities performed at the Site during the reporting period:

- Monthly groundwater level monitoring and sampling was performed in September and October 1998 using 18 pre-existing temporary and permanent groundwater monitoring wells (Plate 2). Each groundwater sample was analyzed for volatile organic compounds (VOCs), dissolved iron, chloride, nitrate/nitrite, CO<sub>2</sub>, ethane, and methane.
- Temporary wellhead monuments were installed in November 1998 to protect groundwater monitoring wells located in the construction area.

VOCs were detected in groundwater samples from each well. Dichloroethene was detected above 100 micrograms per liter ( $\mu\text{g/l}$ ) in 12 of the 18 wells sampled, with a maximum concentration of 41,000  $\mu\text{g/l}$  in WCC-03S. Trichloroethene was detected above 100  $\mu\text{g/l}$  in 17 of the 18 wells sampled, with a maximum concentration of 32,000  $\mu\text{g/l}$  at TMW-02. 1,1,1-trichloroethane was detected above 100  $\mu\text{g/l}$  in two wells, with a maximum concentration of 5,100  $\mu\text{g/l}$ . Toluene and/or benzene was detected in six wells, with a maximum concentration of 68,000  $\mu\text{g/l}$  in WCC-03S. The highest VOC concentrations were found in wells near the northeast corner of Building 1 and downgradient wells to the south and southwest. Lower VOC concentrations were detected in upgradient and crossgradient wells.

## **1.0 INTRODUCTION**

This document presents the results of monthly groundwater monitoring and sampling conducted by Harding Lawson Associates (HLA) in September and October 1998 at the Boeing Realty Corporation (BRC) C-6 facility, 19503 South Normandie Avenue, Los Angeles, California (the Site, Plate 1). Groundwater depths were measured and groundwater samples were collected from 18 groundwater monitoring wells in the area of Buildings 1 and 2 (Plate 2). The wells included nine temporary groundwater monitoring wells installed in June and July 1998 by Kennedy/Jenks Consultants (Kennedy/Jenks) and nine pre-existing groundwater monitoring wells installed by Woodward-Clyde Consultants (Woodward-Clyde). The objective of this effort was to report groundwater information collected at locations within and adjacent to Buildings 1 and 2.

The facility occupies approximately 170 acres and is bounded on the north by West 190th Street, on the east by the railroad tracks along South Normandie Avenue, on the south by Montrose Chemical and residential properties, and on the west by Western Avenue, Capitol Metals, and International Light Metals (Plate 1).

Buildings 1 and 2 are located in the eastern part of the facility, approximately  $\frac{1}{4}$  mile south of 190th Street and approximately 250 feet west of Normandie Avenue. The two buildings cover an area of about 33 acres.

## **2.0 HYDROGEOLOGIC SETTING**

This section provides a brief summary of regional and local geology and hydrogeology. Much of this information was reported by Kennedy/Jenks following the installation of the temporary monitoring wells TMW-01 through TMW-09 in July 1998.

The facility is located on a broad plain at an elevation of approximately 50 feet above mean sea level (MSL). The California Department of Water Resources (DWR) and U.S. Geological Survey (USGS) define this area as the Torrance Plain, a Pleistocene-age marine surface and a subdivision of the Coastal Plain of Los Angeles and Orange Counties. The ground surface in this area is generally flat with an eastward gradient of about 20 feet per mile (less than ½ percent). Surface drainage is generally toward the Dominguez Channel, about a mile to the east. The Dominguez Channel, in turn, flows southeastward toward the Los Angeles and Long Beach Harbors in San Pedro Bay.

The surface sediments in this area are assigned to the Lakewood Formation (DWR, 1961), a unit defined to include essentially all of the upper Pleistocene sediments in the Los Angeles Coastal Plain area. The Lakewood Formation includes deposits of both marine and continental origin, representing stream transport and sedimentation along the Pleistocene marine plain. In the facility area, the Lakewood Formation may include the Semiperched aquifer, the Bellflower aquiclude, and the Gage aquifer and extend from the ground surface to a depth of approximately 200 feet. The Semiperched aquifer includes deposits described as terrace cover (Poland et al., 1959). The extent and thickness of this unit are not rigorously defined, but the unit appears to include near-surface water-bearing sediments in the area of the facility. The Bellflower aquiclude is described as a heterogeneous mixture of continental, marine, and windblown sediments, mainly consisting of clays with sandy and gravelly lenses (DWR, 1961). The base of the Bellflower aquiclude is about 100 feet below sea level (about 150 feet below ground surface [bgs]) in the facility area. The Gage aquifer is a water-bearing zone of fine- to medium-grained sand and gravel confined by the Bellflower aquiclude. It is reported to be about 40 feet thick in the facility area and is described as being of secondary importance as a water source (DWR, 1961).

The Lakewood Formation is underlain by the lower Pleistocene San Pedro Formation, which extends from approximately 200 feet bgs to about 1,000 feet bgs in the facility area. Major water-bearing zones within the

San Pedro Formation are the Lynwood aquifer and the Silverado aquifer. In the facility area, the Lynwood is reported to extend from approximately 250 to 350 feet bgs, and the Silverado is reported to extend from about 475 feet bgs to 675 feet bgs (DWR, 1961). The Silverado is a source of drinking water. Undifferentiated fine-grained sediments, ranging in thickness from approximately 100 to 150 feet, separate the Gage, Lynwood, and Silverado aquifers (DWR, 1961).

Data reported by Kennedy/Jenks and Woodward-Clyde suggest that the uppermost water-bearing zone at the facility is first encountered at depths of 60 to 70 feet and is unconfined. Regionally, this uppermost water-bearing zone may be considered part of the Semiperched aquifer and is separated from the deeper zones by the Bellflower aquiclude (Kennedy/Jenks, 1998).

Most of the monitoring wells at the facility are completed within the Semiperched aquifer, with screened intervals ranging from 60 to 90 feet bgs. Two deeper wells, WCC-1D and WCC-3D, are completed in a deeper zone with screened intervals from 120 to 140 feet bgs (Woodward-Clyde, 1990).

The hydraulic gradient in the uppermost groundwater is generally toward the south-southeast. The July 1998 groundwater gradient was 0.001 foot per foot (ft/ft) (Kennedy/Jenks, 1998). Groundwater samples from 15 observation wells at the facility have been sampled and analyzed on a quarterly basis since 1992.

Subsurface soils are reported to consist of fine sand, silt, and clay. Discrete soil units have been termed Q1 through Q5 and were described in detail following the installation of the temporary monitoring wells (Kennedy/Jenks, 1998). The majority of the onsite groundwater monitoring wells are apparently screened in unit Q5, described as predominantly silty sand and sandy silt. Exceptions are monitoring wells WCC-1D and WCC-3D, with total depths of approximately 140 feet bgs. These wells are potentially screened into the Gage aquifer.

## **3.0 GROUNDWATER MONITORING AND SAMPLING PROGRAM**

### **3.1 Groundwater Level Monitoring**

Monthly groundwater monitoring was performed in 18 wells in September and October 1998. Depth to groundwater was measured in each well (Plate 2) from the top of the well casing. Groundwater elevations were calculated using the surveyed elevation of the top of each well casing. The data from September and October 1998 were contoured and are depicted on Plates 2 and 3, respectively. In general, groundwater flows toward the south-southwest at a gradient of approximately 0.001 ft/ft. Groundwater monitoring data are presented in Table 1.

### **3.2 Monthly Sampling**

A total of 18 monitoring wells were purged and sampled in September and October 1998. During each sampling event, each groundwater monitoring well was purged of a minimum of three well-casing volumes of groundwater or until dry by using an electric submersible pump. A Grundfos Rediflow II or a Whale Pump was used, depending on the necessary purge volume. The Whale Pump is battery operated and was used where lower purge volumes were required. Temperature, pH, and electrical conductivity of the purge water were measured and recorded. Groundwater samples were collected in laboratory-supplied 40-milliliter vials from near the top of the water column in each well using a Teflon bailer. Each sample was labeled and stored in an ice-cooled chest. Two equipment rinsate blank samples and two duplicate samples were collected for quality assurance/quality control (QA/QC) purposes. Groundwater sampling field data forms for each well are included in Appendix A.

Purged groundwater was placed in 630-gallon poly tanks and stored onsite. Following profiling, the purge water was transported offsite for treatment and disposal.

### **3.3 Chemical Analysis**

Chemical analysis of groundwater samples collected in September and October 1998 was performed by Orange Coast Analytical, a state-certified laboratory, in Tustin, California. The samples were maintained in

an ice-cooled chest and delivered to the laboratory within one working day of collection using chain-of-custody protocol.

Each groundwater sample and QA/QC sample was analyzed separately for volatile organic compounds (VOCs) using EPA Test Method 8260A in September and October 1998. Groundwater samples were also analyzed for dissolved iron, chloride, nitrate/nitrite, carbon dioxide ( $\text{CO}_2$ ), ethane, and methane in October 1998 using the methods listed in Table 2. Analytes detected in the groundwater are summarized in Table 2. The laboratory reports and chain-of-custody records are included in Appendix B. For comparison, the analytical results from a previous sampling of the temporary monitoring wells in July 1998 are also included in Table 2.

### **3.4 Observations**

- The groundwater level beneath the BRC C-6 facility decreased approximately 0.10 foot between September and October 1998. The gradient during both events was approximately 0.001 ft/ft to the south-southwest.
- VOCs were detected in groundwater samples from each well. Dichloroethene was detected above 100 micrograms per liter ( $\mu\text{g/l}$ ) in 12 of the 18 wells sampled, with a maximum concentration of 41,000  $\mu\text{g/l}$  in WCC-03S. Trichloroethene was detected above 100  $\mu\text{g/l}$  in 17 of the 18 wells sampled, with a maximum concentration of 32,000  $\mu\text{g/l}$  at TMW-02. 1,1,1-trichloroethane was detected above 100  $\mu\text{g/l}$  in two wells, with a maximum concentration of 5,100  $\mu\text{g/l}$ . Toluene and/or benzene was detected in six wells, with a maximum concentration of 68,000  $\mu\text{g/l}$  in WCC-03S. The highest VOC concentrations were found in wells near the northeast corner of Building 1 and downgradient wells to the south and southwest. Significantly lower VOC concentrations were detected in upgradient and crossgradient wells.  $\text{CO}_2$  was detected in each groundwater sample collected in October 1998, with concentrations ranging from 19 to 130 milligrams per liter (mg/l).
- Nitrate/nitrite was detected in each groundwater sample collected in October 1998, except in sample WCC-03S, with concentrations ranging from 1.1 to 14 mg/l.
- Chloride was detected in each groundwater sample collected in October 1998, with concentrations from 30 to 870 mg/l.
- Dissolved iron was detected in groundwater samples collected in October 1998 in monitoring wells TMW-01, TMW-07 through TMW-09, WCC-03S, and WCC-06S, with a maximum concentration of 28 mg/l.
- Ethane and methane were not detected in groundwater samples in October 1998.

- Dissolved oxygen (DO) measurements were recorded as each well was purged. Recorded DO levels varied between approximately 1.6 and 11.5 mg/l.
- Based on information regarding common industrial usage and the distribution and concentration of VOCs at the Site, the “parent” compounds are TCE, 1,1,1-TCA, and 1,1,2-TCA; the daughter compounds are 1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, 1,1-DCA, and 1,2-DCA (Kennedy/Jenks, 1998). The presence of these daughter compounds indicates that natural attenuation<sup>1</sup> through destructive abiotic and biotic degradation is occurring. Based on our experience at similar sites, it is our opinion that natural attenuation is also occurring due to the non-destructive processes of dispersion and sorption.

### **3.5 Quality Assurance/Quality Control Program**

As part of the QA/QC protocol during the quarterly monitoring and sampling program, an equipment rinsate blank and duplicate sample were collected and submitted for chemical analysis during the September and October 1998 sampling events. A review of the QA/QC sample results indicated the following:

- VOCs were not detected in the equipment blanks.
- VOC concentrations reported for the duplicate samples from TMW-05 and WCC-03D in September 1998 were comparable to those of the original samples.
- VOC concentrations reported for the duplicate samples TMW-07 and WCC-03D in October 1998 were comparable to those of the original samples.

Groundwater monitoring and sampling procedures, including QA/QC procedures, are included in Appendix C.

---

<sup>1</sup> Natural attenuation is defined herein as the reduction in mass or concentration of a compound in groundwater due to naturally occurring processes. Destructive processes include abiotic and biotic degradation. Non-destructive processes include dispersion and sorption.

### **LABORATORY REPORT FORM**

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 1999

Laboratory Director's Name (Print): Mark Noorani

Client: Harding Lawson

Project No.: 40711

Project Name: Boeing

Laboratory Reference: IES 10473

Analytical Method: 8260

Date Sampled: 09/28/98

Date Received: 09/29/98

Date Reported: 10/06/98

Sample Matrix: Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

## QC DATA REPORT

Analysis : Volatile Organics by GC/MS (EPA 8260)

Date of Analysis :10/02/98

Laboratory Sample No : 98090253

Laboratory Reference No : IES 10473

Analyte	R1 (ppb)	SP (ppb)	MS (ppb)	MSD (ppb)	PR1 %	PR2 %	RPD %
Benzene	0.0	20	19	20	95	100	5
1,1-Dichloroethene	0.0	20	19	21	95	105	10
Trichloroethene	0.0	20	19	20	95	100	5
Toluene	0.0	20	19	20	95	100	5
Chlorobenzene	0.0	20	19	21	95	105	10

### Definition of Terms :

R1                  Results Of First Analysis

SP                  Spike Concentration Added to Sample

MS                  Matrix Spike Results

MSD                Matrix Spike Duplicate Results

PR1                Percent Recovery Of MS:  $\{(MS-R1) / SP\} \times 100$

PR2                Percent Recovery Of MSD:  $\{(MSD-R1) / SP\} \times 100$

RPD                Relative Percent Difference:  $\{(MS-MSD) / (MS+MSD)\} \times 100 \times 2$

### LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 1999

Laboratory Director's Name (Print): Mark Noorani

Client: Harding Lawson

Project No.: 42455-1

Project Name: Boeing

Laboratory Reference: HLA 10507

Analytical Method: 8260, 6010A, 325.3, 353.3, 415.1

Date Sampled: 10/16, 20, 21/98

Date Received: 10/21/98

Date Reported: 10/27/98

Sample Matrix: Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

## QC DATA REPORT

Analysis : Volatile Organics by GC/MS (EPA 8260)

Date of Analysis :10/22/98

Laboratory Sample No : 98100156

Laboratory Reference No : HLA 10507

Analyte	R1 (ppb)	SP (ppb)	MS (ppb)	MSD (ppb)	PR1 %	PR2 %	RPD %
Benzene	0.0	20	20	20	100	100	0
1,1-Dichloroethene	0.0	20	19	20	95	100	5
Trichloroethene	0.0	20	20	21	100	105	5
Toluene	0.0	20	19	20	95	100	5
Chlorobenzene	0.0	20	20	21	100	105	5

### Definition of Terms :

R1                  Results Of First Analysis

SP                  Spike Concentration Added to Sample

MS                  Matrix Spike Results

MSD                Matrix Spike Duplicate Results

PR1                Percent Recovery Of MS:  $\{(MS-R1) / SP\} \times 100$

PR2                Percent Recovery Of MSD:  $\{(MSD-R1) / SP\} \times 100$

RPD                Relative Percent Difference:  $\{(MS-MSD) / (MS+MSD)\} \times 100 \times 2$

## QC DATA REPORT

Date of Analysis : 10/22/98  
Laboratory Sample No : 98100162, 98100153, 98100157  
Laboratory Reference No : HLA 10507

Analyte	R1 (ppm)	SP (ppm)	MS (ppm)	MSD (ppm)	PR1 %	PR2 %	RPD %
Chloride	550	500	1030	1040	96	98	1
CO2	63	100	160	167	97	104	4

## LABORATORY REPORT FORM

Laboratory Name: ORANGE COAST ANALYTICAL, INC.

Address: 3002 Dow Suite 532 Tustin, CA 92780

Telephone: (714) 832-0064

### Laboratory Certification

(ELAP) No.: 1416 Expiration Date: 1999

Laboratory Director's Name (Print): Mark Noorani

Client: Harding Lawson

Project No.: 42455-1

Project Name: Boeing

Laboratory Reference: HLA 10507

Analytical Method: 8260, 6010A, 325.3, 353.3, 415.1

Date Sampled: 10/16, 21, 22/98

Date Received: 10/22/98

Date Reported: 10/27/98

Sample Matrix: Water

Chain of Custody Received: Yes

Laboratory Director's Signature: Mark Noorani

**APPENDIX C**

## **APPENDIX C**

### **GROUNDWATER MONITORING AND SAMPLING FIELD PROCEDURES**

## **FIELD PROCEDURES**

### **GROUNDWATER MONITORING**

Groundwater levels were measured using an electronic well sounder. The electronic sounder uses a tape marked in 1-foot increments and intermediate 0.1 foot intervals. Groundwater levels were recorded to the nearest 0.01 foot from an established surveyed measuring point on the top of the monitoring well casing.

Total well depth was measured by lowering the electronic sounder to the bottom of the monitoring well. Depth to water was measured directly off the tape from the measuring point on the top of the well casing. To assure that accurate readings were taken, the electronic sounder was raised and lowered two or three times before recording the measurement on the groundwater sampling form. To minimize the potential for cross-contamination, the monitoring equipment was cleaned between wells by washing with Liqui-Nox and rinsing with deionized water.

#### **Quality Assurance and Quality Control of Field Measurements**

To check the monitoring results, field measurements were compared to the previous month's measurements. If any obvious discrepancies were noted, the well was measured again to ensure that the measurement had been recorded correctly.

Prior to measuring the wells, the monitoring equipment was inspected for any damage, including bends or kinks in the tape. To maintain consistency and precision, the same monitoring equipment was used each month. The tape measures were periodically compared with a calibrated tape measure to check for accuracy and to ensure that the tape measures had not stretched.

#### **Monitoring Well Purging**

The volume of groundwater to be purged from each monitoring well was calculated based on casing volume. The purge water volume was recorded on the groundwater sampling form. The objective of each purging cycle was to remove a minimum of three to four well-casing volumes of water from the well before collecting a sample.

The order in which the wells were purged was from lowest to highest VOC based on data provided by IES for previous groundwater sampling. The wells were pumped by attaching a 1/2-inch-diameter, clear polyvinyl chloride (PVC) hose to the submersible pump and lowering the pump into the monitoring well.

During pumping, the pump was lowered to approximately 5 to 10 feet below the static water level in the monitoring well. As groundwater was extracted from the well, the temperature, pH, and electrical conductivity (EC) were measured.

To minimize the potential for cross contamination, the purging equipment was washed with Liqui-Nox and triple-rinsed with deionized water between wells.

## **Purge Water Handling and Disposal**

Groundwater purged from the monitoring wells and the rinsate water were stored onsite for later profiling and transport to an authorized treatment facility.

## **Groundwater Sample Collection**

A groundwater sample was collected from the monitoring well after a minimum of three to four well-casing volumes of water was removed and the temperature, pH, and EC had stabilized. After purging was completed, the wells were allowed to recover to within 80 percent of their prepurge level before samples were collected. In general, the wells recovered almost instantaneously to their prepurge level after purging and were sampled immediately.

The monitoring wells were sampled by using a 1.5-inch-diameter Teflon bailer with a bottom check ball. The wells were sampled in the same order as they were purged. The bailer was lowered to the approximate location of the pump intake. The water sample was decanted from the bottom of the bailer into two 40-milliliter glass sample vials using a sampling port. The vials were carefully filled to avoid overflow. The vials were immediately sealed with Teflon-lined screw lids so that the formation of air bubbles was avoided. Once the vial was sealed, it was inverted to ensure that no air bubbles had been trapped. If air bubbles were present, the water sample was discarded, and the procedure was repeated until two vials were collected. To minimize the potential for cross contamination, the sampling bailer was washed with Liqui-Nox and triple-rinsed with demineralized water between monitoring wells.

Once collected, the samples were labeled with the monitoring well identification number and the date and time of sample collection. The samples were double-bagged in plastic Ziploc bags and immediately placed in an ice chest filled with "blue ice" or equivalent. The samples were recorded on a chain-of-custody form prepared and signed by the person(s) collecting the samples. Prior to shipment, the samples were carefully packed with foam padding to avoid breakage of the sample vials during transport. The samples were then delivered to the State-certified laboratory performing the analyses.

## **Quality Assurance and Quality Control of Field Procedures**

During the field work, written field reports were prepared daily, documenting the work activities and any unusual events or occurrences. Groundwater monitoring and sampling report forms were also prepared. At the end of each sampling day or as soon as possible, the written reports and the groundwater monitoring and sampling reports were reviewed by the task manager for completeness and accuracy of data collected. Any unusual occurrences or discrepancies in the field work being performed were noted by the task manager on the written reports and on the groundwater monitoring and sampling reports. The task manager then communicated the discrepancies to the field personnel to verify the reports prior to beginning the following day's field work and/or the next month's sampling round.

## **Quality Assurance and Quality Control Samples**

To provide for quality assurance and quality control (QA/QC) documentation during each sampling round, a minimum of one duplicate and one equipment rinsate blank were collected per event. A trip blank was also prepared in the field and/or by a State-certified laboratory and transported with each batch of samples (if the trip blank was prepared in the field, distilled water was used). The QA/QC samples were labeled with a predetermined sample number and shipped with the other samples. To reduce the

possibility of the QA/QC samples being identified by the laboratory performing the analyses, the QA/QC samples were recorded on the same chain-of-custody form used for the other samples.

## **LABORATORY ANALYSIS**

### **Laboratory Performing the Analyses and Certifications**

Orange Coast Analytical Laboratory in Tustin, performed the analyses during the monitoring and sampling efforts.

### **Quality Assurance and Quality Control of Laboratory Data**

When the laboratory reports were received from the laboratory, data were reviewed for completeness and accuracy. The review process consisted of validating the following:

- Chain-of-custody documentation for completeness and signatures by laboratory sample control personnel,
- Type and method of analyses performed,
- Date of extraction and analysis for each batch of samples analyzed by the laboratory; confirmation that samples were analyzed within the prescribed 14-day holding time,
- That matrix spikes, duplicates, method blanks, and surrogates were analyzed and if results were within the prescribed warning and control limits specified for each analyte,
- Comparison of results with the results of original samples analyzed for any duplicates, splits, and spiked samples submitted blindly to the laboratory with the results of original samples analyzed, and
- Signature of the laboratory QA/QC officer verifying that all tests performed met the prescribed procedures.
